Business Operations — Process Improvement — SQL, Excel, Power BI — Strategy

Professional Summary

Business Operations professional with 3+ years owning cost, inventory, billing and client growth for a small B2B supplier. Cut input costs 17-20% through supplier renegotiation, reduced unsold stock from about INR 5-6 lakh to INR 1-2 lakh, and grew the client base from 1 to 5 institutional accounts. Backs decisions with SQL, Excel and Power BI, shown in two portfolio case studies (synthetic data) on client onboarding throughput and risk-based KYC controls.

Work Experience

Business Operations Analyst May 2023 – Present

Small B2B supplier to institutional clients; INR 60-70 lakh annual revenue; team of 5 *Bengaluru, India*

- Scoped and ran a client acquisition programme across 30+ prospective accounts, building an Excel tracking framework and converting 4 new accounts to grow the client base from 1 to 5
- Led supplier renegotiation, cutting per-unit input costs by 17-20% and improving annual profit by INR 3+ lakh
- Owned a 10-day inventory review cycle across 2,000-3,000 SKUs a year, reducing unsold stock from about INR 5-6 lakh to INR 1-2 lakh
- Audited billing records, found an underbilling gap, and recovered INR 35,000-40,000 in revenue
- Led a weekly cross-functional review across sales and finance, turning operational data into forecasts and status reports for planning decisions
- Guided four team members in handling client queries and follow-ups across accounts serving 500-1,000 end customers each

Projects

FLOW: Customer Onboarding Throughput Diagnostic and Decision Model

Fictional B2B SaaS SQL (MySQL), Excel, Power BI

- Analysed a synthetic 7-stage onboarding process (2,711 applications, Oct 2025 - Sep 2026) in MySQL: 49.2% attainment against a 35-day SLA, 40.8-day mean and 70-day P90 cycle time, and a backlog that grew from 203 to 360 against a 240/month target
- Identified Finance Approval as the top process bottleneck using a multi-factor ranking of queue time, backlog growth and rework rather than average duration alone; quantified rework at about 20% of applications and roughly 29,800 minutes of effort across four return loops
- Built a 7-tab Excel decision model comparing no change, process redesign, added staffing, and redesign plus staffing under conservative, base and optimistic cases; modelled that no option reaches 240/month in the base case, with redesign plus targeted staffing closest at a 17 cases/month gap
- Built a 4-page Power BI report with documented DAX and KPI definitions; validated the dataset by detecting all 12 injected data-quality problems and reconciling all 12 monthly backlog balances

TRIAGE: Risk-Based Client Onboarding and KYC Controls

2,000 synthetic applicants SQL (MySQL), Python, Power BI

- Designed a deterministic risk-tiering process (Low/Medium/High, with PEP and sanctions matches overriding to Enhanced Due Diligence) to replace uniform identity verification, balancing Product's speed goals against Compliance's scrutiny requirements
- Tested the control with a precision/recall sweep across thresholds 20 to 75; set the escalation threshold at 50 instead of the F1-optimal 40 to keep Enhanced Due Diligence referrals at 15.2% rather than 32.2%, accepting lower recall (32% vs 55%) for a workable review caseload
- Measured friction by tier in the simulated data (average completion 4.0, 17.8 and 57.2 minutes; 21.85% drop-off at document upload) and documented model limits, with a Power BI dashboard that flags small-sample segments

Skills

Tools: SQL(MySQL: joins, window functions), Excel (PivotTables, named assumptions, scenario models), Power BI (DAX, dashboards), Python, Jira

Operations & Process: Process mapping and redesign, bottleneck analysis, capacity planning, SLA and KPI design, rework and root-cause analysis, workflow controls, process automation, continuous improvement, stakeholder management, cross-functional coordination

Commercial & Finance Operations: Supplier negotiation, cost reduction, billing audit and revenue recovery, inventory control, forecasting and management reporting, business-case, scenario and sensitivity modelling

Risk and Controls: Risk-based onboarding, threshold and trade-off analysis (precision/recall), KPI definition and data-quality validation

Education

CHRIST (Deemed to be University) Bengaluru, India

Master of Computer Applications (MCA) *Expected May 2027*

JAIN (Deemed to be University) Bengaluru, India

Bachelor of Computer Applications (BCA) *May 2025*
